

FPA Queens Road Small Cap Value Fund

September 30, 2025

FPA
FUNDS

Overview

The Fund seeks to generate returns in excess of the Russell 2000 Value Index over full market cycles with less risk.

- **Small companies:** Use fundamental, bottom-up analysis to construct a diversified portfolio of small-capitalization companies.¹
- **Value philosophy:** Research process is built on the principle that companies in sound financial condition trading at discounts to their intrinsic value provide the greatest likelihood of maximizing after tax returns while limiting volatility.
- **Patient & disciplined process:** We look for small cap companies with sound balance sheets, compelling valuations, strong management teams, in favorable industries.

Page 1 Footnotes:

The performance and other statistics shown for the period prior to November 1, 2020, reflects the historical performance of the FPA Queens Road Small Cap Value Fund - Investor Class ("Fund") when Bragg Financial Advisors, Inc. ("BFA") served as investment adviser of the Fund.

¹Please see the Fund Risks for information about small-capitalization companies. ²Return Capture is calculated by comparing the Fund's annualized return (net of fees) since inception to that of the Russell 2000 Value Index. Risk Capture is calculated by comparing the Fund's standard deviation since inception to the standard deviation of the Russell 2000 Value Index. ³10-Year Risk/Return Profile graph plots the return and risk (measured by standard deviation) for a selection of securities and a benchmark index for the trailing period identified. The returns noted for a security reflect any sales charges that were applied in the illustration over the time period selected, but do not reflect impacts of taxation. If impacts of taxation were reflected, the returns would be lower than those indicated. The return plotted in the graph is mean geometric return. Standard deviation is a statistical measure of the volatility of the security's or portfolio's returns in relation to the mean return. The larger the standard deviation, the greater the volatility of return in relation to the mean return. ⁴The minimum initial investment in Investor Class, Advisor Class, and Institutional Class shares is \$1,500, \$1,500, and \$100,000, respectively. The Fund has established different initial investment minimums for retirement accounts and accounts established with a pre-authorized investment plan. Please see the Prospectus for more detail. ⁵Index data source: Morningstar. Fund performance is shown net of all fees and expenses, and is calculated on a total return basis which includes reinvestment of all distributions. Periods greater than one year are annualized. Fund performance does not reflect the deduction of taxes that a shareholder would pay on Fund distributions or the redemption of Fund shares, which would lower these figures.

From inception of the Fund to December 31, 2004, BFA and its affiliates voluntarily absorbed certain expenses of the Fund and voluntarily waived its management fee. Had BFA not done this, returns would have been lower during that period. Effective January 1, 2005 through October 31, 2020, BFA charged a single unitary management fee and contractually agreed to pay all operating expenses of the Fund except for brokerage, taxes, interest, litigation expenses, and other extraordinary expenses. Prior to November 1, 2020, the Fund had a unitized fee structure that limited annual operating expenses to 1.18%.

Page 2 Footnotes:

⁶Active Share is defined as the percentage of the Fund's portfolio that differs from the Fund's benchmark. ⁷Cash includes an investment in a short-term treasury ETF. ⁸Sector classification reflects GICS (Global Industry Classification Standard). ⁹Top 10 Holdings excludes cash and cash equivalents. Data is subject to change. ¹⁰Source: Morningstar Direct, FPA. The table shows drawdowns of 20% or larger for the Russell 2000 Value Index since the Fund's inception on June 13, 2002. Fund returns are shown net of all fees and expenses and include reinvestment of distributions. There have been five Russell 2000 Value Index drawdowns of 20% since June 2002. ¹¹Calculated using weighted harmonic averaging, which helps avoid extreme results that may occur due to small relative numbers. ¹²Portfolio Statistics begin July 1, 2002 using monthly data.

Important Information

You should consider the Fund's investment objectives, risks, and charges and expenses carefully before you invest. The Prospectus details the Fund's objective and policies, charges, and other matters of interest to the prospective investor. Please read the Prospectus carefully before investing.

Holdings related data may be preliminary, is subject to change, and may differ from the Fund's holdings disclosed in its annual/semiannual report and Form N-Q due to availability of data at the time this report was produced. Portfolio composition will change due to ongoing management of the Fund. References to individual securities or sectors are for informational purposes only and should not be construed as recommendations by the Fund, the portfolio manager, the Adviser, sub-adviser, or the distributor. It should not be assumed that future investments will be profitable or will equal the performance of the security examples discussed. The portfolio holdings as of the most recent quarter-end may be obtained at fpa.com.

Bragg Financial Advisors, Inc. serves as the sub-adviser for the FPA Queens Road Small Cap Value Fund. Steven H. Scruggs, the Fund's Portfolio Manager, is an employee of Bragg Financial Advisors, Inc.

Fund Risks

Small Capitalization Companies: The FPA Queens Road Small Cap Value Fund primarily invests in equity securities (common stocks, preferred stocks, and convertible securities) of small-capitalization U.S. companies, defined as those with market capitalization, at time of purchase, is no greater than the largest market capitalization of any company included in the Russell 2000 Index. Investing in small companies involves special risks including, but not limited to, the following: smaller companies typically have more risk and their company stock prices are more volatile than that of large companies; their securities may be less liquid and may be thinly traded which makes it more difficult to dispose of them at prevailing market prices; these companies may be more adversely affected by poor economic or market conditions; they may have limited product lines, limited access to financial resources, and may be dependent on a limited management group; and small cap stocks may fluctuate independently of large cap stocks. All investment decisions are made at the discretion of the Portfolio Manager, in accordance with the then current Prospectus.

Investments carry risks and investors may lose principal value. Capital markets are volatile and can decline significantly in response to adverse issuer, political, regulatory, market, or economic developments. Small and mid cap stocks involve greater risks and they can fluctuate in price more than larger company stocks. Short-selling involves increased risks and transaction costs. You risk paying more for a security than you received from its sale.

Value style investing presents the risk that the holdings or securities may never reach their full market value because the market fails to recognize what the portfolio management team considers the true business value or because the portfolio management team has misjudged those values. In addition, value style investing may fall out of favor and underperform growth or other styles of investing during given periods.

Please refer to the Fund's **prospectus** for a complete overview of the primary risks associated with the Fund.

Index and Category Definitions

The performance of the indices are computed on a total return basis which includes reinvestment of all distributions. The Fund may be less diversified than the indices noted herein, and may hold non-index securities or securities that are not comparable to those contained in an index. Indices may hold positions that are not within the investment strategy. Indices are unmanaged and returns do not reflect transaction costs, investment management fees or other commissions, or fees and expenses that would reduce performance for an investor. An investor cannot invest directly in an index.

Russell 2000 Value Index measures the performance of the small-cap value segment of the U.S. equity universe. It includes those Russell 2000 companies that are considered more value oriented relative to the overall market as defined by Russell's leading style methodology.

The Fund's Morningstar peer group is the **Morningstar Small Value** Category. **Morningstar Small Value** portfolios invest in small U.S. companies with valuations and growth rates below other small-cap peers. Stocks in the bottom 10% of the capitalization of the U.S. equity market are defined as small cap. Value is defined based on low valuations (low price ratios and high dividend yields) and slow growth (low growth rates for earnings, sales, book value, and cash flow). As of September 30, 2025, there were 487 funds in the category.

Glossary

Beta describes the activity of a security's returns responding to swings in the market. A security's beta is calculated by dividing the product of the covariance of the security's returns and the market's returns by the variance of the market's returns over a specified period.

Correlation is a statistic that measures the degree to which two securities move in relation to each other which has a value in the range of -1 to +1.

Downside capture ratio is used to evaluate how well an investment manager performed relative to an index during periods when that index has fallen. The ratio is calculated by dividing the manager's returns by the returns of the index during the down market, and multiplying that factor by 100.

Price/Book ratio is the market price of a stock divided by the book value per share.

Sharpe Ratio is a risk-adjusted measure calculated by subtracting the risk-free rate from the return of the portfolio and dividing that result by the standard deviation of the portfolio's excess return.

Sortino Ratio takes an asset or portfolio's return and subtracts the risk-free rate, and then divides that amount by the asset's downside deviation.

Standard Deviation is a measurement of risk or variability of returns over time. Higher deviation represents higher volatility.
